

CRANIOSACRAL THERAPY

How is CranioSacral Therapy Performed?

CranioSacral Therapy is performed on a person fully clothed. Using a light touch – generally no more than the weight of a nickel – the practitioner monitors the rhythm of the craniosacral system to detect restrictions and imbalances. The therapist then uses delicate manual techniques to release those problem areas and relieve undue pressure on the brain and spinal cord.

A CranioSacral Therapy session can last from about 15 minutes to more than an hour and the initial evaluation alone is often enough to correct a problem. The result? A central nervous system free of restrictions and a body that's able to return to its greatest levels of performance.

Who Can Perform CranioSacral Therapy?

Because of its positive effect on so many body functions, CranioSacral Therapy is practiced today by a wide variety of healthcare professionals. They include osteopathic physicians, allopathic physicians, chiropractors, naturopaths, psychiatric specialists, psychologists, dentists, physical therapists, massage therapists, acupuncturists and other professional body workers.

What conditions Does CranioSacral Therapy address?

CranioSacral Therapy strengthens your body's ability to take better care of you. It helps alleviate a range of illness, pain and dysfunction, including:

- Migraines and Headaches
- Chronic Neck and Back pain
- Motor-Coordination Impairments
- Stress and tension-related Problems
- Infantile Disorders
- Traumatic Brain and spinal cord Injuries
- Chronic Fatigue
- Scoliosis
- Central Nervous System Disorders
- Emotional Difficulties
- Temporomandibular Joint Syndrome (TMJ)
- Learning Disabilities
- Post-Traumatic Stress Disorder (PTSD)
- Orthopedic Problems
- Many other conditions

"To me, the practice of CranioSacral Therapy is miracle. After my accident I felt ungrounded and off-center for a very long time, both physically and in mental function, in spite of massage therapy, physical therapy, chiropractic and psychotherapy for post-traumatic stress. CranioSacral Therapy was the only treatment that got to the core of what was wrong. Until then, no one had acknowledged the physical cause of what I had been experiencing."

- D.J., New York, NY

The Therapeutic Value of CranioSacral Therapy

While the validity of the cardiovascular and respiratory rhythms is undisputed today, for eons the very existence of these systems sparked debates in medical communities around the globe.

Now, for nearly 30 years, osteopathic physician and researcher, John E. Upledger, has been a proponent of using the rhythm of another body system – the craniosacral system – to enhance body functioning and help alleviate pain and discomfort.

The craniosacral system consists of the membranes and cerebrospinal fluid that surround and protect the brain and spinal cord. It extends from the bones of the skull, face and mouth, which make up the cranium, down to the sacrum, or “tailbone” area.

Since this vital system influences the development and performance of the brain and spinal cord, an imbalance or restriction in it could potentially cause any number of sensory, motor or neurological disabilities. These problems could include chronic pain, eye difficulties, scoliosis, motor-coordination impairments, learning disabilities and other health challenges.

CranioSacral Therapy is a gentle method of detection and correction that encourages your own natural healing mechanisms to dissipate these negative effects of stress on your central nervous system. You also benefit from better overall health and resistance to disease.

How Did CranioSacral Therapy Begin?

CranioSacral Therapy dates back to 1970 when osteopathic physician John E. Upledger first witnessed the rhythmic movement of the craniosacral system during a spinal surgery, a phenomenon that none of his colleagues or medical texts could explain.

Two years later, Dr. Upledger attended a short course on cranial osteopathy developed by Dr. William Sutherland. The course focused on the bones of the skull and the fact – surprising at the time – that they weren't fused as doctors had been taught in medical school. Instead, Sutherland's material demonstrated that skull bones continue to move throughout a person's life.

Putting this new information together with the odd pulsing rhythm he'd observed years before, Dr. Upledger theorized that a hydraulic system of sorts was functioning inside the craniosacral system. He then set out to confirm his theories.

In 1975 he joined the osteopathic College at Michigan State University as a clinical researcher and Professor of Biomechanics. There he led a team of anatomists, physiologists, biophysicists and bioengineers to test and document the influence of therapy on the craniosacral system. For the first time they were able to explain the function of the craniosacral system and demonstrate how light-touch therapy could be used to evaluate and treat malfunctions involving the brain and spinal cord.

In 1985 Dr. Upledger went on to establish the Upledger Institute to teach the public and healthcare practitioners about the benefits of CranioSacral Therapy. To date, the Institute has trained more than 50,000 health care practitioners worldwide in the use of CranioSacral Therapy.
